

The Pictures tell the Story ...

Acid water and plants

IonLife takes much pleasure in congratulating 11 year old Mason Cahoon on his science award. Mason was competing with many students a lot older and got the idea for his experiment from watching his dad using a Jupiter Melody. Mason did all the testing and data collection using Excel on a computer.

The tests were conducted over three weeks using Ivy plants and the results speak for themselves. On this amazing planet, plants like to drink acid water as they "breath out" oxygen and "breath in" carbon dioxide. In comparison, humans strive on clean, alkaline, ionized water as they breath in oxygen and breath out carbon dioxide.
